

**Figure S2**

**Trimmed means of symptom numbers and age at symptom onset in probands (N = 1068).**

Notes: Figures on the left side show 20% trimmed means per centre in ascending order. Horizontal lines above the bars indicate subgroups of significant pairwise differences. Each centre indicated by a vertical mark at the left side of the double slash (//) significantly differs from each site indicated by a vertical mark on the right side of the double slash, defined as non-overlapping 95% familywise confidence intervals.

For each variable with a significant site by gender interaction, trimmed means in boys and girls are shown in the figures on the right side.
